# QoVision Digital Signage Software

A new high impact digital signage solution enabling you to design and update your screen content in-house.

QoVision is cost-effective and intuitive software for professional signage displays without the need for a programming specialist. It offers flexibility for the experienced user and intuitive design features for the novice.

QoVision integrates still images, video, audio, 3D animation, RSS feeds and many more audio-visual elements and manages them through your network high resolution display.

## Content Editor

The Content Editor allows you to create screen content by taking previously created visual elements as well as the included background templates and add them to the page, where ever you would like them to appear.

With Content Editor, you can create text files, import PPT shows in their entirety including all standard transitions, effects and sounds. Add in audio files including MP3. Use PNG files to create intergrated screen layouts.

QoVision Content Editor allows you to create multiple video zones, RSS input along with GIF and Flash files. You can also add website and HTML files including all flash and video files. Qomo supplies a selection of live Flash clocks to add to your page layout.

Content Editor also provides real time integration of new data with pre-created content elements allowing your screens to look fresh and up to the minute with news, weather and stock information from the internet.

Text can be added to the page layouts with up to 100% transparency over images on screen.

### Please find a summary below.

- Choose Landscape or Portrait orientation
- Select Aspect Ratio and best resolution
- Layer and position each element on screen
- Auto alignment of each zone on the page
- Preview selected items before committing to page
- Create multi page screen sequences
- Choose from live video or broadcast through video card or indeed stream video via a streaming device
- Access live websites and HTML files
- Create one or multiple video zones. The video formats supported include: MPEG 1, 2, and 4; AVI, WMV, ASF, Quick Time, and Real Player
- Add audio files in the following formats: WAV, MP3, WMA GIF
- Add FLASH animation
- Add Still graphics supported: BMP, JPEG, GIF, and TGA create more interest by adding transitions
- Design your text message to scroll or crawl in various speeds with transparency; horizontally or vertically even have it stop and then continue
- Import PowerPoint in its entirety; no need to recreate your effects or transitions
- Input data from text file or input from ODBC database
- Create RSS zones and paste in the URL for live information such as news, weather forecasts, stock information or whatever RSS you choose to create and support
- Real-time date and time viewable in text or graphically

## NetManager

NetManager is designed to deliver all of your content to each Mistral player on time every time, locally, nationally or globally. With NetManager you can remotely access the schedule and make changes keeping you in touch constantly with your information system.

Users of NetManager are offered full control of their networked system. Including – 24/7 scheduling and remote control of content play lists. More advanced features offer the ability to schedule each networked Mistral player to be turned on and off at specific times of day lowering your energy consumption during times when your screens do not need to be on.

NetManager offers the ability to send ad hoc messages to each, grouped or all Mistral 1 players on the network immediately. When an emergency occurs, you can quickly and effectively send out your message and have that message displayed wherever you require.

If you have stored content that can be re used then this can also be accessed and dispatched throughout the Digital Signage system.

### NetManager summary

- Manage hundreds of players via LAN, WAN, or Video networks
- Remote access for managing network
- Create and send emergency messages instantly or send prepared messages as an override to your presentation
- Remotely play, stop and change your content, plus turn Mistral players on and off remotely
- Flexible schedule displays easily for additions and changes

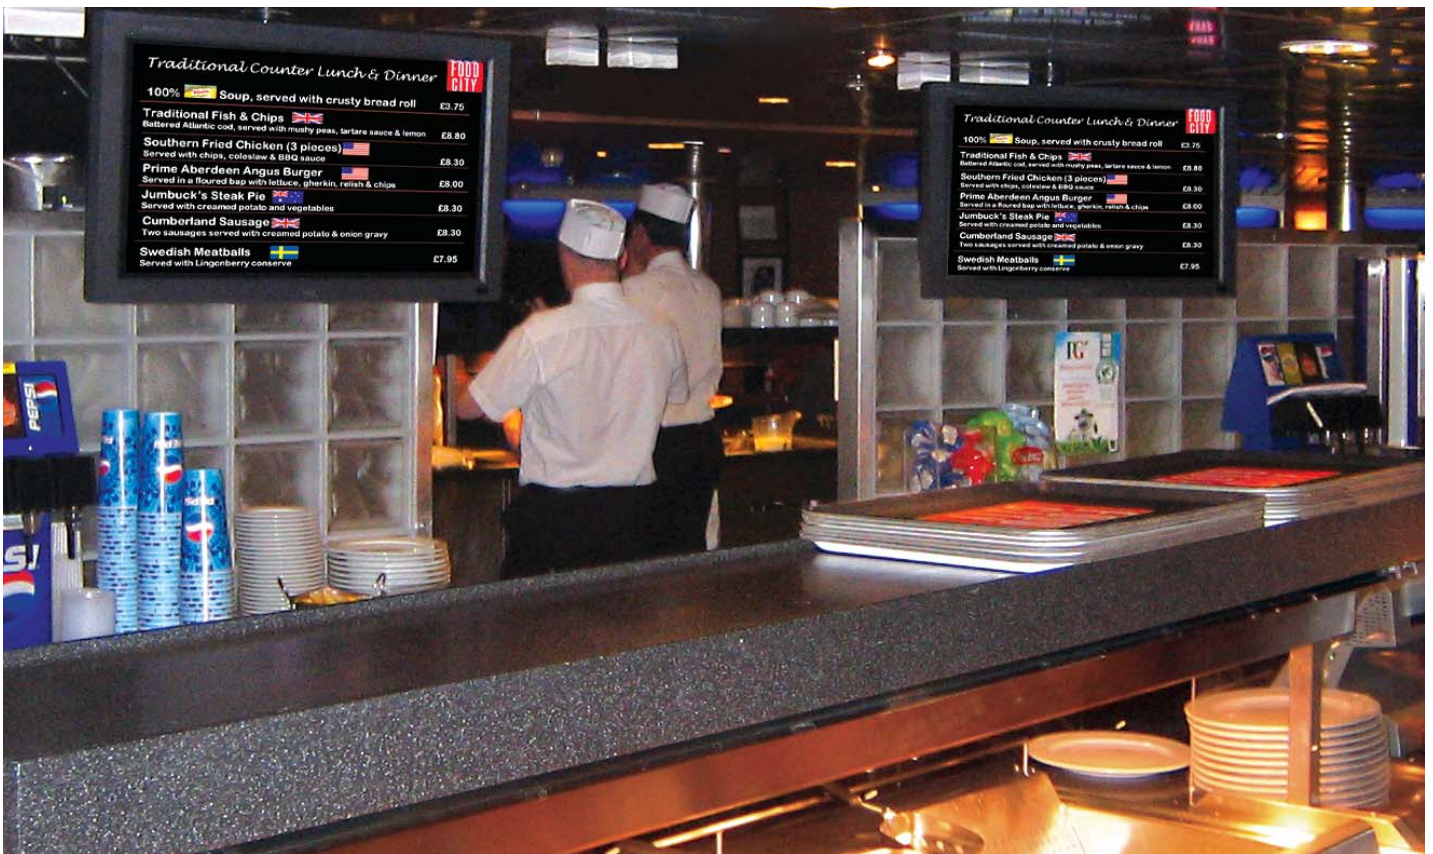

## Player

The player software is designed to receive its commands from the NetManager and display the message on each assigned display via the Mistral 1 player. Whether you are utilizing the latest flat panel TFT displays, projectors, video walls or the like the player will communicate accurately. Each display where individual content is required then a Mistral 1 player with QoVision Player software included should be connected to each display.

## Applications

- Corporate Communications
- Educational Facilities
- Retail Banking
- Retail Stores and Shopping Malls
- Medical Facilities
- Government Organizations
- Transportation Information
- Hotels and Restaurants
- Commercial Advertising
- Entertainment and Hospitality Channels

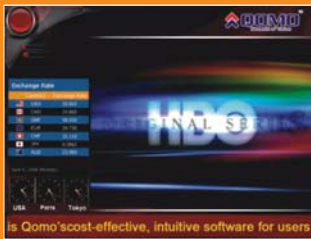

**CASE STUDY: Stena Line**

A network of digital signage screens with QoVision software was supplied aboard four Irish Sea ferries of the Stena Line. The company operates daily services from Belfast to Stranraer, Rosslare to Fishguard and Dublin to Holyhead.

The screens are easily updated, providing passengers with a dynamic and dramatically improved standard of information displays. The requirements included replacement of existing static menu boards in the ships' Food City restaurants with NEC 40" LCD displays. Each screen has a QoVision digital signage player installed, allowing different content to be shown on each display.

Existing on-board plasma displays were connected to a QoVision signage player with its output split to four screens, displaying currency exchange rates, on-board offers and product advertising. Another player is connected to an existing matrix switcher, enabling extra content to be shown on any of the screens as required. New cabling was installed for the restaurant displays, while other screens receive content via the existing on-board data cabling system.
